PROFILE

Quality engineer with 13+ years in quality assurance, starting in game QA at Megaxus Infotech and progressing to mobile, API, and performance testing at Stockbit / Bibit to leading a team of 30 QA engineers across applications at PERURI (INA Digital). I help teams decide what to test, automate the checks that repeat, and turn test results into release decisions, including for user journeys that span several teams. Currently building AI Agent Speed, an AI-assisted test triage workflow with human review gates.

HIGHLIGHTS

- Lead a team of 30 QA engineers on a superapp integration that consolidates 14 standalone applications, plus 3 new application projects.
- Automated 99% of critical user journeys with one framework for web, mobile, and API.
- Reduced post-release incidents by 50% and test creation time by 80% with AI-assisted test generation.

PROFESSIONAL EXPERIENCE

PERURI (INA DIGITAL) | Jakarta

Lead Quality Engineer *Jan 2025 – Present*

Superapp integration that consolidates 14 standalone applications into one platform, plus 3 new application projects.

- Lead and mentor a team of 30 QA engineers, working with development squads of 10–20 developers per application.
- Defined the integration test strategy, using contract testing and service virtualization so squads can test in parallel before dependent services are ready.
- Coordinate shared regression checks for journeys that cross applications and run one release review covering scope, test evidence, open risks, and the go/no-go decision.
- Built two shared automation core libraries used across test projects: API Test Core (Java 17, RestAssured, Cucumber) and Web Test Core (TypeScript, Playwright, Cucumber), released as versioned packages through CI. Automated tests cover 99% of critical user journeys.
- Introduced AI-assisted test generation that turns PRD documents into Gherkin scenarios with the Gemini API, alongside Postman-to-Gherkin and K6 script generators, reducing test creation time by 80%.
- Reduced post-release incidents by 50% through pre-release validation of integrated journeys.
- Standardized QA documentation with 8 templates covering the test lifecycle: test plan, SIT, UAT, performance, execution summary, regression, security, and test closure.
- Building AI Agent Speed, an AI-assisted test triage workflow with human review gates.

Tools: Java 17, TypeScript, Playwright, RestAssured, Cucumber, Appium, Selenium, K6, Postman, Jenkins, GitHub Actions, Maven, npm, Docker, Kubernetes, AWS, Allure, Gemini API

Senior Quality Engineer *Oct 2024 – Jan 2025*

- Led a QA team of 15 engineers, providing mentoring, technical guidance, and career development.
- Set company-wide QA standards and automated quality gates in Jenkins so tests run on every deployment, reducing release cycle time by 50%.
- Built automation frameworks for web (Playwright, Katalon, Selenium), API (RestAssured), and mobile (Appium).
- Introduced K6 performance testing (smoke, load, stress, soak, and breakpoint scenarios) and early security checks for XSS, SQL injection, and broken access control.
- Built failure notifications to Google Chat so teams see failed runs as they happen.

STOCKBIT / BIBIT | Jakarta

Test Engineer *May 2022 – Oct 2024*

- Built and maintained mobile automation with Appium and Cucumber (BDD) and web automation with Katalon; tested Android and iOS devices, cutting testing time by 70%.
- Ran K6 performance tests to find bottlenecks on the Stockbit trading platform.
- Planned functional, integration, regression, and exploratory tests in Xray and Jira. Used Postman and Ruby for API checks, maintained GitLab CI pipelines, and integrated Allure reports.
- Performed basic security testing and mentored junior QA engineers on automation practice.

MEGAXUS INFOTECH |

Quality Assurance Analyst *Nov 2019 – Apr 2022*

Game Quality Assurance / Tester *Feb 2013 – Nov 2019*

- Planned test cases and coverage from requirements and executed them on live and test servers; investigated and documented game bugs and exploits, collected user feedback for improvements, and managed the game community around events and updates. Assisted with automation for selected modules.

KEY INITIATIVES

AI Agent Speed *PERURI · INA Digital*

- AI-assisted test triage: the agent collects evidence (trace, logs, request ID), classifies the failure as product, test, test data, or environment, and may restore test data, rerun, or propose a locator fix.
- Stops for a human reviewer before changing what counts as a pass, and escalates instead of guessing when evidence is missing.

- Verified with 44/44 checks across four local suites using controlled inputs; live model accuracy not yet measured.
- Outcome: failures reach reviewers pre-classified with evidence, instead of as raw logs — and the agent never changes what counts as a pass on its own.

API Test Core and Web Test Core *INA Digital · private*

- Shared foundations for API and web automation: authentication across services, generic request and assertion steps, JSON schema validation, multi-environment config, test data from Google Sheets, OTP extraction from email, and QA tools such as Gherkin coverage analysis and Allure-to-Excel export. Each merge to main bumps the version, publishes the package, and notifies the team.
- Outcome: two versioned packages shared across test projects, so API and web suites reuse the same auth, assertions, and test-data plumbing.

AI-assisted test generation *PERURI · INA Digital*

- PRD documents turned into Gherkin scenarios through the Gemini API, alongside Postman-to-Gherkin and K6 script generators. Test creation time down 80%.
- Outcome: PRDs become reviewable Gherkin scenarios with 80% less test creation time.

Performance Testing Calculator *GitHub · public*

- Plans load tests with Little's Law: single-API and end-to-end modes, inputs from VUs, RPS, TPS, daily or monthly transactions, or user base, test levels from 70% to 150%, and k6 instance sizing. github.com/Samuelpangestu/performance-test-calculator
- Outcome: a working planner, live on samuelpgt.com, that sizes virtual users and k6 instances from a target request rate.

K6 Performance Test Framework *GitHub · public*

- Smoke, load, stress, soak, and breakpoint scenarios with shared config and HTML reports. github.com/Samuelpangestu/performance-test
- Outcome: one framework covering smoke through breakpoint testing, with shared config and HTML reports for every run.

Jenkins QA Library *GitHub · public*

- Reusable Jenkins pipeline utilities for API test runs, Allure reports, object storage, and notifications. github.com/Samuelpangestu/inadigital-qa-library
- Outcome: pipeline setup shared as one reusable library — test runs, Allure reports, object storage, and Google Chat notifications.

QA Test Management System *GitHub · public*

- Google Sheets and Apps Script suite for test case management, execution tracking, dashboards, team KPIs, and meeting reminders, with CI deployment. github.com/Samuelpangestu/apps-script-automation-tools
- Outcome: cases, execution, dashboards, and team KPIs in one Sheets-based suite, deployed by CI.

QA Document Templates and Release Readiness Checklist *GitHub · public*

- Eight test lifecycle templates mapped from test plan to closure report, plus a go/no-go checklist published at samuelpgt.com. github.com/Samuelpangestu/qa-document-templates
- Outcome: the full test-documentation lifecycle covered by eight templates, plus a published go/no-go checklist.

QA Platform Local Recorder *Chrome extension*

- Published on the Chrome Web Store. Records browser actions into Playwright drafts for the QA Platform, replaces entered values with placeholders before upload, and offers bounded agent assistance. Chrome Web Store listing
- Outcome: published on the Chrome Web Store (v0.3.6) — browser actions become reviewable Playwright drafts, with entered values redacted before upload.

SKILLS

- Test automation: Playwright, Selenium, Katalon Studio, Appium, Cucumber (BDD), Page Object Model
- API and integration: RestAssured, Postman, JSON schema validation, data-driven tests (Excel, Google Sheets), contract testing, service virtualization
- Performance and security: K6, security testing basics (XSS, SQL injection, access control)
- Languages: Java 17 (JUnit 5, TestNG), TypeScript / JavaScript, Groovy, Google Apps Script
- CI/CD and packaging: Jenkins shared libraries, GitHub Actions, GitHub Packages, Maven, npm, clasp, Docker, Kubernetes, AWS
- Test management and reporting: Jira, Allure, Google Sheets dashboards
- AI in testing: Gemini API for PRD-to-Gherkin generation, agent-based failure triage with human review

EDUCATION

Bina Nusantara University | Jakarta *2019 – 2023*

Bachelor of Computer Science, Information Systems. GPA 3.91/4.00, Summa Cum Laude. Outstanding Student Award 2022, Information Systems Study Program.

CERTIFICATIONS AND TRAINING

- ISTQB Certified Tester Foundation Level (CTFL), 2025
- IDSTB Conference, 2024
- Bootcamp Automation Android, Stockbit, 2023
- Quality Assurance Automation, SanberCode, 2022
- Test Automation University (2022–2023): test automation foundations, Selenium IDE, locator strategies, JUnit 5, IntelliJ for test automation
